# FORT OF CYBER SECURITY

## 14 WAYS TO PROTECT YOUR BUSINESS

### Security Assessment

It's important to establish a baseline and close existing vulnerabilities.

### Spam Email

Most attacks originate in your email. We'll help you choose a service designed to reduce spam and your exposure to attacks on your staff via email.

### Passwords

Apply security policies on your network. Deny or limit USB file storage access, enable enhanced password policies, set timeouts & limit user access.

### Security Awareness

Train your users! Teach them about data security, email attacks, and your policies and procedures. With web-based training and security policies.

### Endpoint Detection & Response

Protect your data from malware, viruses, & cyber attacks with advanced endpoint security. The latest technology protects against fileless and script based threats & can rollback a ransomware attack.

### Multi-Factor Authentication

Use MFA whenever you can; on your network, banking websites & social media. It adds an additional layer of protection to ensure that even if your password does get stolen, your data stays protected.

### Computer Updates

Keep Microsoft, Adobe, and Java products updated for better security. We provide a "critical update" service via automation to protect your computers from the latest known attacks.

### Dark Web Research

Knowing in real-time what passwords & accounts have been posted on the Dark Web will allow you to be proactive in preventing a data breach. We scan the Dark Web & take action to protect your business.

## SIEM/Log Management

Uses big data engines to review all event and security logs from all covered devices to protect against advanced threats and to meet compliance requirements.

## Web Gateway Security

Internet security is a race against time. Cloud based security detects web and email threats as they emerge on the internet, and blocks them on your network within seconds – before they reach the user.

## Mobile Device Security

Today's cyber criminals attempt to steal data or access your network by way of your employees' phones and tablets. They're counting on you to neglect this piece of the puzzle.

## Firewall

Turn on Intrusion Detection and Intrusion Prevention features. Send the log files to a managed SIEM. And if your IT team doesn't know what these things are, call us today!

## Encryption

Whenever possible, the goal is to encrypt files at rest, in motion (think email) and especially on mobile devices.

## Backup

Backup local and to the cloud. Have an offline backup for each month of the year. Test your backups often. And if you aren't convinced your backups are working properly, call us ASAP.

# ARE YOU CYBER SAFE?

*Test your defences by booking your free  
Cyber Security assessment today.*
